

Religions' Temporal Worldviews and Their Social Effects

Executive summary

Religions do not merely “have” a view of time; they embed multiple temporal layers that shape meaning and action: cosmic time (creation, cycles, dissolution), moral time (karma/judgment and the “accounting” of deeds), ritual time (calendars that periodically re-present foundational events), and mystical time (a timeless or “unconditioned” ultimate reality). ¹

Across traditions, “pure” temporal models (linear vs cyclical vs atemporal) are best treated as **ideal types**: many religions combine linear narrative (e.g., creation-to-end) with cyclical liturgy (annual holy days) and atemporal metaphysics (divine eternity or nirvanic “unconditioned”). ²

These temporal models influence social life by shaping (a) perceived **time horizons** (short vs long), (b) **accountability structures** (future judgment or karmic causality), (c) **legitimacy of change** (progressive revelation, restoration, or return), and (d) the **institutionalization of memory** (scriptural canon, ritual cycles, ancestor veneration). ³

Empirically, the strongest quantitative work tends to link (i) **future-oriented beliefs and time perspectives** to individual decision-making, and (ii) certain religious belief complexes—especially **afterlife/judgment beliefs**—to economic attitudes and country-level growth patterns, while also emphasizing identification challenges and confounding (institutions, education, regulation of religion, history, geography). ⁴

Taxonomy of temporal models in world religions

This taxonomy treats each model as a **dominant temporal accent** that can coexist with others inside the same tradition.

Linear historical time (time as a non-repeatable story with an origin and a real “later”). Exemplars: Judaism (prophetic history and later resurrection/apocalyptic strands), Christianity, Islam, Zoroastrianism; many new religious movements inherit this linear frame. ⁵

Eschatological / teleological time (history oriented toward a culminating judgment, renewal, or consummation). Typically layered onto linear history: Christianity’s “new heaven and new earth,” Islam’s Day of Judgment and disclosure of deeds, Zoroastrian “final renovation” (frašgird / frashokereti). ⁶

Cyclical cosmic time (repeating ages/eons; recurrent cosmogenesis; samsara/rebirth cycles). Exemplars: Hindu traditions (yugas/kalpas and return), Buddhism (beginningless samsara), Jainism (ascending/descending halves of cosmic time), Sikhism (cycle of birth-and-death motif, alongside devotion and divine order). ⁷

Spiral / recurring-with-progress (repetition with cumulative development: the “same kinds” of events recur, but on a moving trajectory—moral, revelatory, or civilizational). Exemplars: Bahá’í progressive revelation (renewal of guidance suited to each age); some Buddhist and Hindu modernist interpretations that combine cycles with moral/civilizational development; reformist theologies in Abrahamic faiths that frame history as progressive realization. ⁸

Eternal / atemporal (timeless ultimate) (ultimate reality beyond temporal succession; liberation/union characterized as “unconditioned,” “beyond time”). Exemplars: Buddhist nibbāna as “unborn...unconditioned,” Vedantic/Upanishadic Brahman beyond time and space, Dao as an underlying source with “returning” as a fundamental motion (often paired with cyclical naturalism). ⁹

Two-tier time: sacred vs profane (ritual re-presentation) (historical time exists, but ritual time “re-enters” foundational events; sacred time is reversible/recoverable). Exemplars: many Indigenous traditions (e.g., Australian Aboriginal “everywhen” tied to the Dreaming), as well as liturgical religions broadly (including parts of Christianity and Judaism). ¹⁰

Apocalyptic-imminent time (compressed horizon: the end is near; urgency reorders priorities). Exemplars: medieval and modern millenarian movements; segments of Christian apocalypticism and some new religious movements; revitalization movements often arise under stress and can include messianic/millenarian variants. ¹¹

Doctrinal and historical foundations by model

Linear-eschatological (Abrahamic and Zoroastrian family resemblance)

Doctrinal basis: a meaningful historical arc—creation/founding acts → covenant/prophecy → judgment/renewal—creates a “direction” to time. In Judaism, apocalyptic resurrection language (e.g., “many...who sleep...will wake...to eternal life...or...contempt”) articulates an ultimate moral horizon. ¹² In Christianity, Revelation explicitly imagines a terminal transformation (“new heaven and new earth”) and frames divine sovereignty in comprehensive temporal terms (“Alpha and Omega...beginning and the end”). ¹³ In Islam, the Day of Judgment is portrayed as a time when people are shown the consequences of deeds, down to “an atom’s weight,” centering moral time in future accountability. ¹⁴ Islam also strongly affirms divine transcendence across time (“He is the First and the Last...”), which often adds an atemporal layer to an otherwise linear eschatology. ¹⁵

Historical development (high-level): prophetic/apocalyptic strands intensified in late Second Temple Judaism and shaped early Christianity’s eschatological imagination; Islam (7th century onward) inherits and reconfigures biblical apocalyptic themes into Qur’anic discourse; Zoroastrian tradition preserved elaborate cosmic-historical dualism and an end-time renovation in later Middle Persian literature. ¹⁶

Cyclical-karmic time (Hindu, Buddhist, Jain, Sikh patterns)

Doctrinal basis: moral causality is distributed across multiple lives or eons; worldly states recur; liberation is possible (often as an exit from the cycle). In the Bhagavad Gita, cosmic cycles are explicit: worlds “up to Brahmaloṇa” are “returning,” and “day and night” of Brahma are described in thousand-yuga measures. ¹⁷ Early Buddhist discourse depicts saṃsāra as without discoverable beginning, while also presenting liberation as possible. ¹⁸ Jain cosmology formalizes time as endless with alternating descending/ascending half-cycles (avasarpinī / utsarpinī), often described as systematic eras with changing moral

conditions. ¹⁹ Sikh scripture frequently uses the idiom of release from the “cycle of reincarnation” through devotion to the Divine Name (Naam), combining karmic-cyclical language with a strong emphasis on divine order (hukam). ²⁰

Historical development (high-level): the karmic-rebirth complex emerges and diversifies across South Asian traditions; Buddhist and Jain movements develop distinctive soteriologies (nirvana/kevala) that aim at exit from cyclicity; Sikhism (15th–17th centuries) inherits South Asian rebirth language but reframes it through devotion, ethics, and monotheistic sovereignty. ²¹

Eternal/atemporal time (mystical metaphysics across traditions)

Doctrinal basis: the ultimate is not merely “endless time,” but a different mode (unconditioned, beyond temporal distinctions). A canonical Buddhist formulation states that there is an “unborn...unmade...unconditioned,” making liberation conceptually a transcendence of conditioned temporality rather than an improved cycle. ²² Some Upanishadic/Vedantic strands describe the sought essence as undetermined by “space [and] time,” emphasizing an absolute reality that grounds—but is not contained by—temporal processes. ²³ Daoist classic texts often emphasize “returning” as the Dao’s movement, blending cyclical cosmology with an underlying Dao conceived as prior to naming and ordinary distinctions. ²⁴

Historical development (high-level): atemporal metaphysics frequently co-develops with contemplative practices and elites’ philosophical reflection (monastic scholasticism, mystical traditions, meditative lineages), and can coexist with communal ritual time and moral time. ²⁵

Sacred/profane two-tier time (ritual as temporal technology)

Doctrinal basis: sacred time is periodically “reintegrated”; it is reversible and recoverable in ritual practice, unlike ordinary historical duration. Eliade’s classic formulation describes “sacred time” as “circular...reversible and recoverable,” periodically reintegrated through rites. ²⁶ In Indigenous Australian contexts, scholars report a conception of the Dreaming as an “everywhen,” not fixable as simply past. ²⁷

Historical development (high-level): ritual calendars become institutional scaffolding for social memory, coordinating group life and legitimating authority through recurrent reactivation of origins; in many Indigenous contexts, time is tightly relational to land, kinship, and story rather than abstract chronology. ²⁸

Spiral/progressive time (renewal without finality)

Doctrinal basis: “return” is interpreted as renewal at a higher level, often via successive revelations or dispensations adapted to changing social conditions. In Bahá’í authoritative texts, revelation is framed as age-suited: “For every age requireth a fresh measure of the light of God,” explicitly coupling time with adaptive governance and ethics. ²⁹

Historical development (high-level): progressive-revelation models often crystallize in modern or reform contexts that must reconcile continuity of truth with rapid social change; they tend to produce strong institution-building programs meant to be globally portable. ³⁰

Apocalyptic-imminent time (urgent teleology)

Doctrinal basis: heightened imminence transforms time into countdown, reordering norms (purity, separation, evangelism) and legitimating extraordinary action. Historical scholarship on millenarian movements foregrounds how apocalyptic expectation can intertwine with social anxiety and upheaval. ³¹

Anthropological theory of “revitalization movements” classifies messianic/millenarian variants as organized efforts to construct a more satisfying culture under stress. ³²

Social and behavioral effects by model

The links below are **mechanistic** (how temporal ideas plausibly shape behavior and institutions) rather than deterministic (“religion X causes outcome Y”). They are also conditional on political economy, education systems, and historical context. ³³

Linear-eschatological time tends to externalize accountability into a future horizon, encouraging self-monitoring and norm enforcement: deeds will be revealed or repaid (Qur’an) and history culminates in transformation (Revelation). ³⁴ One pathway to social effects is through **intertemporal self-regulation** (delayed gratification, planning): psychological work on time perspective treats temporal orientation as a pervasive influence on decision-making rather than a mere metaphor. ³⁵ Historically, linear-teleological frameworks can legitimate **reform and “making history”** (missions, abolitionism, social gospel, Islamic reform movements), but can also legitimate conservative restorationist projects depending on interpretive politics; the model itself mainly supplies a *directional narrative* that actors can mobilize. ³⁶

Institutionally, linear traditions often intensify **text, law, and education**: scriptural authority stabilizes norms across generations, while future judgment frames law as morally consequential rather than merely conventional. Empirically, Protestant contexts are frequently discussed because scripture reading encouraged literacy; a prominent economic history test argues that Protestant economic advantage is substantially explained by Bible-linked human capital formation (rather than an unmeasured “ethic” alone). ³⁷

Cyclical-karmic models can extend the moral time horizon dramatically (across lives/eons), which can support patience and ethical restraint—yet they can also be interpreted in fatalistic ways (“what is, is karmically deserved”), potentially stabilizing hierarchy. ³⁸ In practice, cyclicity often anchors rich **life-cycle rituals** (birth, death, rebirth, merit transfer), normalizing continuity and resilience amid social volatility. ³⁹ Attitudes toward innovation can vary: cyclicity may privilege alignment with dharma/natural order over rupture, but it does not imply technological stagnation—cycles can coexist with sophisticated mathematics, astronomy, medicine, and statecraft in Hindu-Buddhist-Jain civilizations. (This is a historically broad claim; empirical cross-tradition isolation of “time model” from institutions is difficult.) ⁴⁰

Eternal/atemporal models often shift emphasis from control of the future to transformation of perception and attachment, producing cultural prestige for contemplation (monasticism, meditation lineages, mystical disciplines). ⁹ The social effect can be a bifurcation: strong support for renunciant institutions alongside householders’ pragmatic time (work, family, politics). This can lower some forms of material striving while raising investment in religious education and life-discipline. ⁴¹ On the micro-level, research linking religiosity and time perspective suggests that certain positive aspects of religiosity correlate with “Past-Positive” and “Future(-Positive)” time perspectives, indicating that religiosity can coexist with future orientation rather than implying present-only focus. ⁴²

Sacred/profane two-tier time strengthens social cohesion and identity through synchronized recurrence. When ritual “returns” a community to foundational time, it renews norms, re-legitimizes authority, and compresses generational memory into repeatable forms. ⁴³ In Indigenous contexts where time is relational to land and story, “everywhen” framings can support long-run stewardship ethics by

embedding obligations to ancestors, country, and future beings in a continuous moral landscape. ²⁸ This does not straightforwardly predict “low innovation,” but it often predicts innovation under constraints of custodianship and continuity rather than innovation-as-disruption. ⁴⁴

Spiral/progressive models tend to legitimate adaptation as continuity, reducing the perceived contradiction between tradition and reform. The Bahá’í principle that each age requires a “fresh measure” of divine light explicitly authorizes institutional and social recalibration over time. ²⁹ Where institutionalized, this can promote a culture of planned change (education initiatives, consultative governance norms) while still preserving continuity in identity. (Rigorous cross-national causal measurement of this specific temporal mechanism is limited.) ⁴⁰

Apocalyptic-imminent models often reallocate attention from long-term planning to urgent alignment, which can increase risk-taking and boundary-making (who is “in,” who is “out”), raising both internal solidarity and potential conflict with external institutions. ⁴⁵ Historical evidence shows millenarian movements repeatedly acting as vehicles for social aspirations and animosities under conditions of anxiety and unrest. ³¹

Empirical evidence on societal outcomes and the causation problem

The hardest empirical problem is separating “time worldview” from correlated factors: state capacity, colonial disruption, education systems, economic structure, climate, and the way modernity reshapes both religion and time discipline (clocks, wage labor, bureaucracies). ⁴⁰

Evidence map visual

Evidence strength map: temporal worldview ↔ societal outcomes (heuristic synthesis)

[Download the heatmap image](#)

This heatmap summarizes **how strong and how direct** the empirical literature is by pairing each temporal model with outcome domains (0–3, where higher values reflect more multi-method or quasi-experimental work). It does **not** represent effect sizes and should not be read as “which religion performs better.” ⁴⁶

Quantitative and quasi-experimental strands most relevant to temporal worldview

A major cross-country econometric study of religiosity and growth finds (using instrumental variables based on state religion, regulation, pluralism, and religion shares) that **economic growth is positively associated with beliefs in heaven/hell (and afterlife) but negatively with church attendance**, interpreting this as “believing” vs “belonging.” This is conceptually adjacent to *eschatological moral time* because heaven/hell beliefs embed future-oriented accountability. ⁴⁷

Using individual-level World Values Survey data with country fixed effects, another influential paper links intensity of religious beliefs to multiple economic attitudes (cooperation, government, legal rules, thrift, market orientation), reporting that religious beliefs are associated on average with attitudes they define as

conductive to higher income/growth, while also noting tradeoffs (e.g., more racism; less favorable attitudes to working women) and denomination differences. ⁴⁸ This does not isolate “time worldview” alone, but it provides measurable attitude channels through which temporal doctrines (judgment, karma, providence) could operate. ⁴⁹

In Protestant economic history, a highly cited quasi-experimental design uses distance to Wittenberg as an instrument for Protestantism in 19th-century Prussia, finding Protestant areas had higher prosperity and greater literacy, consistent with human capital mechanisms (Bible reading) rather than an unmeasured cultural “ethic” alone. This evidence is relevant because literacy is a long-horizon investment and a key institutional pathway through which linear-scriptural worldviews can reshape economic capacity. ⁵⁰

Cross-cultural psychology provides a bridge between temporal orientation and development indicators: a synthesis chapter reports that culture-level “future orientation” factors (including planning and investing in the future) correlate positively with national wealth and HDI in a 73-country integration (Milfont & Gapski), while also warning that time-orientation measures vary and equivalence testing is often missing. ⁵¹ This supports a plausible link: **time horizons matter**, but it also underscores measurement challenges when attributing differences to religion rather than institutions. ⁵¹

Micro-level psychology linking religion and time orientation

Time perspective theory operationalizes how people partition experience into past/present/future categories and argues these orientations influence behavior and self-regulation. ³⁵ A peer-reviewed study on religiosity and time perspectives reports that positive religiosity correlates with Past-Positive and Future(-Positive) orientations, while a present focus correlates with more instrumental and fundamentalist approaches (with associations remaining after controlling for personality traits). ⁴² This matters because it weakens simplistic claims like “religion = present-focused” and suggests that different **religious styles** can map onto different temporal profiles with potential downstream effects on planning, risk, and cooperation. ⁵²

Case-based evidence: governance, conflict, and social movements

For apocalyptic-imminent time, historical scholarship emphasizes recurring patterns: millenarian expectations can catalyze radical mobilization and social conflict, often amid perceived crisis. ³¹ Wallace’s classic anthropological framework treats revitalization movements—including messianic and millenarian types—as organized cultural responses to collective stress, offering a mechanism for when and why “end-time” temporalities become politically salient. ³²

For Indigenous sacred time, peer-reviewed and academic-press sources emphasize temporalities that are not well reduced to linear-vs-cyclical: the Dreaming as “everywhen” and relational time tied to land and ethics can shape governance norms (custodianship, reciprocity) and cultural persistence. ⁵³ Quantifying these effects as GDP growth or “tech adoption” is often methodologically and ethically fraught, because colonization and dispossession dominate the causal landscape. ⁵⁴

Comparative table and suggested visuals

Comparative table

Temporal model	Exemplifying religions/traditions	Doctrinal basis (primary texts)	Typical behavioral tendencies (mechanisms, not destinies)	Likely cultural/institutional effects	Example societies often discussed (illustrative)
Linear historical	Judaism; Christianity; Islam; Zoroastrianism; many NRMs	Resurrection/ultimate outcomes in Daniel 12:2. ¹² New creation in Rev 21 & comprehensive temporal sovereignty in Rev 22:13. ¹³ Qur'anic judgment/accounting (e.g., 99:6–8). ¹⁴	Longer narrative horizons; moral accountability “in the future”; legitimacy of reform or restoration through history. ⁵⁵	Text-centered education; legal codification; reform movements; high mobilization capacity. ³⁷	Late-antique and medieval Abrahamic polities; modern Protestant Europe/US (in Weber debate). ⁵⁶
Eschatological/teleological	Christianity; Islam; Zoroastrianism; apocalyptic Judaism; some NRMs	Final transformation (Rev 21). ⁵⁷ Deeds shown (Qur'an 99:6–8). ¹⁴ Zoroastrian frašgird/frashokereti (Bundahišn tradition). ⁵⁸	Future-oriented sanctioning (judgment); potential urgency; heightened meaning of ethical choices. ⁵⁹	Can support cooperation and work discipline (hypothesized), but effects depend on institutions and interpretation. ⁶⁰	Christian/Islamic reform and revival waves; Zoroastrian late antique cosmology. ⁶¹

Temporal model	Exemplifying religions/traditions	Doctrinal basis (primary texts)	Typical behavioral tendencies (mechanisms, not destinies)	Likely cultural/institutional effects	Example societies often discussed (illustrative)
Cyclical-karmic	Hindu; Buddhist; Jain; Sikh (partly)	Cosmic “return” and Brahma day/night cycles (BG 8:16–17). ¹⁷ Beginningless samsara (SN 15). ⁶² Jain ascending/descending cycles (Tattvārtha tradition). ⁶³ Sikh liberation from reincarnation cycle (SGGS). ⁶⁴	Extended moral horizon (across lives); resilience/acceptance; can be read as either moral responsibility or fatalism. ³⁹	Strong ritual life-cycle institutions; monastic/renunciant support; potential stabilization of hierarchy in some contexts. ⁶⁵	Classical/medieval South Asia; Buddhist monastic civilizations. ¹⁸
Eternal/atemporal	Buddhist nirvana doctrines; Vedanta/Upanishads; Daoism; mystical strands in many faiths	“Unborn...unmade...unconditioned” (Ud 8.3). ⁶⁶ Essence beyond space/time (Upanishadic translation). ²³ “Returning” as Dao’s movement (DDJ 40). ²⁴	Present-centered practice (contemplation); de-emphasis of worldly accumulation; inward discipline. ⁶⁷	Institutional prominence of monastic/meditative training; moral authority of ascetic exemplars. ⁶⁶	Buddhist monastic cultures; Vedantic philosophical traditions; Daoist-inspired lifeways. ⁶⁷
Spiral/progressive	Bahá’í; some reformist theologies; modernist syntheses	Revelation suited to each age (“fresh measure”). ⁶⁸	Change-as-continuity; planned reform; innovation legitimated as faithful adaptation. ⁶⁹	Institution building oriented to modern governance norms (education, consultation); global portability. ³⁰	Modern global religious movements; reform-oriented communities. ⁷⁰

Temporal model	Exemplifying religions/traditions	Doctrinal basis (primary texts)	Typical behavioral tendencies (mechanisms, not destinies)	Likely cultural/institutional effects	Example societies often discussed (illustrative)
Sacred/profane cyclical	Many Indigenous traditions; liturgical strands broadly; Confucian ritual time as continuity	Sacred time "circular... recoverable" via rites (Eliade). ²⁶ Dreaming as "everywhen." ²⁷ Confucian valorization of "warming the old to know the new" (Analects 2.11). ⁷¹	Periodic renewal; tradition-preserving learning; synchronized communal identity. ⁷²	Strong calendrical institutions; ancestor/land linkages; continuity norms; governance via custom/ritual. ⁷³	Australian Aboriginal lifeworlds; imperial Chinese ritual order; liturgical societies. ⁷⁴
Apocalyptic-imminent	Millenarian Christianity; some NRMs; crisis revitalizations	Millenarian movement scholarship (Cohn). ⁷⁵ Revitalization movements under stress (Wallace). ³²	Urgency, high commitment, boundary-making; short planning horizons; heightened risk tolerance. ⁷⁶	Social volatility; bursts of mobilization; occasional violent conflict; rapid community formation. ⁴⁵	Medieval European millenarian waves; modern apocalyptic sects. ³¹
