

Understanding Libertarian Morality

Executive Summary

"Understanding Libertarian Morality" most plausibly refers to the widely cited, peer-reviewed PLOS ONE research article "**Understanding Libertarian Morality: The Psychological Dispositions of Self-Identified Libertarians**" by Ravi Iyer, Spassena Koleva, Jesse Graham, Peter Ditto, and Jonathan Haidt, published **August 21, 2012** (DOI: 10.1371/journal.pone.0042366). ¹

Although sometimes described in popular commentary as a "moral philosophy" piece, the paper is primarily **descriptive moral psychology**: it aims to *empirically characterize* how self-identified libertarians differ from liberals and conservatives in moral values, emotions, cognitive style, and social relatedness, using large web-based samples from YourMorals.org. ¹

The paper's headline claims are that (relative to self-identified liberals and conservatives) **libertarians** in their dataset show: (a) **very strong endorsement of liberty** as a guiding moral principle and **weaker endorsement of most other moral principles**; (b) a **more "cerebral," analytic self-presentation and profile** (e.g., higher systemizing and need for cognition, more utilitarian responses to classic dilemmas); and (c) **lower social relatedness / interdependence**, consistent with a more individualistic orientation. ²

A major conceptual contribution is how the authors connect libertarianism to **Moral Foundations Theory (MFT)** and argue that early MFT measurement did not adequately capture libertarians' central moral concern—**liberty**—prompting the creation of **liberty items** in the "moral foundations" style. ³

In later scholarship, the paper is frequently used as (1) a key empirical data point in the MFT ecosystem and (2) evidence in broader debates about whether ideological groups differ in *moral intuitions* versus *self-reports about moral principles*. Subsequent work includes both **extensions** (e.g., richer work on liberty as a moral domain and on systemizing/empathizing links) and **methodological critiques** (e.g., concerns about MFQ measurement, self-selected samples, and possible overstatement of cross-ideology moral differences). ⁴

Citation footprint (as of the latest available sources in this research run): the paper shows **~1,231 citations on Google Scholar** (from Ravi Iyer's Scholar profile listing). ⁵

Identifying and accessing the target paper

Disambiguation and the “exact” paper located

The title string “Understanding Libertarian Morality” appears in at least two closely related forms in the public record:

- The **final, published, standard reference** is the 2012 PLOS ONE article “**Understanding Libertarian Morality: The Psychological Dispositions of Self-Identified Libertarians.**” ¹
- Popular press discussions before publication refer to an earlier manuscript version (with a different subtitle, “The Psychological Roots of an Individualist Ideology”) as “under review,” which strongly suggests a **pre-publication version of the same research program**, not a separate canonical work. ⁶

Following your instruction (“assume the most-cited/standard paper titled ‘Understanding Libertarian Morality’”), this report treats the **2012 PLOS ONE article** as the target. ⁷

Bibliographic record and where it was read

- **Full text (official, open access):** PLOS ONE article page and printable/PDF versions. ¹
- **Publication details:** Published **August 21, 2012** in PLOS ONE. ⁸
- **Full reference list:** The article contains a numbered reference list reaching at least **#88** (ending with William James, 1902). ⁹

What “libertarian” means in the study

Participants self-selected an ideology label from a dropdown that explicitly included “libertarian.” In the US sample analyzed, **7.6% (N = 11,994)** of American visitors chose “libertarian,” compared to larger shares choosing one of the liberal options. ¹⁰

The authors also check that this label corresponds to the common US understanding: compared with conservatives, libertarians in the sample report **more liberal** stances on “social issues” and **more conservative** stances on “economic issues,” with concrete examples such as gay marriage and abortion attitudes reported in the text. ¹⁰

Explaining the paper in accessible terms

Central question and thesis

The paper’s animating question is: **What moral-psychological profile predicts (or at least accompanies) libertarian self-identification, as distinct from liberal and conservative self-identification?** ¹

Its overarching thesis is that libertarianism is not just “conservative economics + liberal social policy,” but a distinctive constellation of **moral values (especially liberty), dispositions (emotion and cognition), and social preferences** that differs systematically from both mainstream liberal and conservative profiles. ¹¹

Structure of the argument

The authors organize the empirical work around **three broad predictions**, then test them across multiple measures (they describe “16 surveys,” with varying Ns per measure) drawn from the YourMorals.org participant pool. ¹

Conceptually, the paper uses an “intuitionist” framing: moral judgments and moralized political commitments are linked to underlying **emotional dispositions**, not only explicit reasoning. ¹²

Methods in plain language

Data source: YourMorals.org, an online platform where visitors complete psychological questionnaires and receive feedback on their scores. The authors emphasize that this is a **volunteer internet sample**, not a nationally representative probability sample. ¹³

Design logic: Instead of one tightly controlled lab study, the paper aggregates evidence across many instruments (moral foundations, values scales, empathy, disgust, reactance, dilemmas, etc.), frequently with very large Ns, looking for a **consistent cross-measure pattern** that differentiates libertarians from liberals and conservatives. ¹³

Important limitation (acknowledged by the authors): because many measures are self-report and the sample is non-representative, findings should be read as **comparative patterns within this dataset**, not population prevalence statements about “what percent of libertarians are X.” ¹⁴

Key findings by the paper’s three predictions

Liberty as “dominant” moral concern, weaker endorsement of other moral concerns

A central empirical claim is that libertarians are distinctive in endorsing liberty as their top guiding principle while showing weaker endorsement of many other moral principles that are more central for liberals and conservatives. ¹

A particularly influential methodological move is that the authors add “**Lifestyle Liberty**” and “**Economic Liberty**” items (presented as “liberty foundation” measures) alongside the standard MFT “five foundations” framework, motivated by the idea that early MFT questionnaires did not directly measure liberty. ³

“Cerebral” profile: less emotion-driven, more analytic/self-described rational orientation

The authors report libertarians scoring lower on some measures of moral emotion and higher on measures associated with analytic or system-based thinking.

A few examples (as reported in the paper):

- **Empathic concern:** Libertarians score **lower** than conservatives and (especially) liberals on *empathic concern* (IRI empathic concern), while looking more similar on some other subscales. ¹⁵
- **Disgust sensitivity:** Libertarians score lower than conservatives; differences vs liberals partially reflect gender composition (men typically lower in disgust). ¹⁶

- **Psychological reactance:** Libertarians score higher on reactance (resistance to restrictions on freedom), which the authors interpret as fitting liberty as a “moralized” concern. ¹⁶
- **Empathizing vs systemizing:** Libertarians are reported as lowest on empathizing and highest on systemizing, and uniquely showing systemizing > empathizing on average. ¹⁷
- **Moral dilemmas (utilitarian choices):** Libertarians are reported as more willing to endorse utilitarian sacrifices than conservatives (and slightly more than liberals) in classic dilemma variants. ¹⁸

Lower social relatedness and interdependence

In the paper’s third cluster of measures, libertarians are reported as showing **lower broad and tight social connection** (i.e., lower connection both to wide circles and to close group-oriented ties), summarized in the paper’s factor analysis and figure discussion. ¹⁹

The paper’s “story” about how people become libertarians

The authors explicitly present a *non-causal but coherent narrative* linking “level 1” traits/dispositions to “level 2” values and “level 3” ideological identity. In their account, people higher in openness and reactance may be drawn to liberty-centered classical liberal values; if they are also more individualistic and lower in empathic concern, they may feel less pull toward redistributive/“positive liberty” liberalism; if they then encounter libertarian philosophical narratives (e.g., Rand or Ron Paul), the narrative resonates and reinforces identity and moral beliefs. ²⁰

The paper also reports structural modeling suggesting that the effects of dispositional variables on libertarian self-identification are largely mediated by values (with particularly large mediated proportions via the empathic concern → individualizing values path and reactance → liberty values path, in their reported mediation analysis). ²¹

Limitations the authors acknowledge

They foreground two core limitations: (1) heavy reliance on **self-report**, and (2) a **non-representative volunteer internet sample**, with demographic skews relative to a representative US sample. ¹³

At the same time, they argue that convergence across diverse measures (including dilemma tasks and a cognitive reflection task) and robustness checks by referrer subsamples and gender help mitigate (not eliminate) concerns about systematic deception or purely artifact-driven results. ²²

Foundations and central references the paper relies on

This section focuses on **references that are structurally central** to the paper’s arguments—i.e., they supply (a) the theoretical frame, (b) the measurement toolkit, or (c) key interpretive scaffolding for the results. “Central” here is defined pragmatically: sources that the paper repeatedly builds on to motivate predictions, interpret findings, or operationalize constructs. ²³

Moral psychology framework

Social intuitionism / “intuitionist” moral judgment is a core assumption: the paper frames libertarian moral/political attitudes as related to underlying emotional dispositions and cognitive-emotional dynamics, drawing on moral intuitionist models. ¹²

Moral Foundations Theory (MFT) is the key taxonomic framework they use to define common moral “dimensions” (harm/care, fairness/reciprocity, ingroup/loyalty, authority/respect, purity/sanctity), and to set up how libertarians might differ. ²⁴

Liberty as a moral dimension is the paper’s signature “bridge” between libertarianism and MFT. The authors explicitly note that early MFT measurement did not include liberty and report creating liberty questions “in the style” of MFT measurement to respond to libertarian objections that core moral concerns were missing. ³

Political philosophy references as interpretive anchors

Although the paper is empirical psychology, it uses classic political philosophy to clarify what “liberty” means in libertarian thought and how libertarians differ from modern liberals:

- **Locke (Two Treatises of Government)** appears as an anchor for early liberal/libertarian understandings of rights and “property” as encompassing life, liberty, and estates. ²⁵
- **Isaiah Berlin (Four Essays on Liberty)** appears to frame the distinction between “negative liberty” (freedom from interference) and “positive liberty” (conditions/entitlements enabling life plans), which the authors use to interpret why libertarians reject coercive redistribution while modern liberals may endorse it. ²⁵
- **Rawls (A Theory of Justice)** functions as a canonical reference point for modern liberal egalitarian justification (again, mainly serving contrastive explanatory purposes in the narrative). ²⁵
- **Ayn Rand** is used both epigraphically and interpretively as emblematic of an individualist moral rhetoric that resonates with some libertarians and fits the paper’s “independence/anti-altruism” theme. ²⁶

Core measurement and construct references

The paper’s conclusions depend heavily on established scales and paradigms, including:

- **Interpersonal Reactivity Index (IRI)** as the basis for parsing empathy into components and highlighting libertarians’ lower empathic concern. ¹⁵
- **Disgust sensitivity** measures as part of the broader “moral emotions” literature differentiating conservatives and liberals and situating libertarians relative to both. ²⁷
- **Psychological reactance** as an affective/motivational response to constraints, used to interpret liberty valuation psychologically. ¹⁶
- **Greene-style sacrificial dilemmas** as a canonical paradigm for distinguishing different styles of moral judgment (often described as “utilitarian” vs “deontological” in the broader literature), used here to place libertarians on a “more utilitarian” pattern. ²⁸

Major references the paper relies on, with roles

Below is a *practical* list (not exhaustive) of major references and what they do in the paper's argumentative machinery. Each is explicitly present in the paper's reference list. ²⁹

Reference (as cited in the paper)	Why it matters in this paper
Haidt (2001) "The emotional dog and its rational tail"	Core theoretical grounding for the "intuitionist" view of moral judgment that motivates looking at emotions/dispositions, not just explicit ideology. ³⁰
Graham, Haidt & Nosek (2009) "Liberals and conservatives rely on different sets of moral foundations"	Empirical baseline for ideology differences in MFT; libertarian profile is framed as distinct from both groups. ³¹
Graham et al. (2011) "Mapping the moral domain"	Provides the MFQ and related measurement backbone; also part of the same research network that enables comparisons and extensions. ³²
Berlin (1969) <i>Four Essays on Liberty</i>	Supplies the negative vs positive liberty distinction used to explain why libertarians reject coerced altruism/redistribution. ²⁵
Locke (1690/1988 ed.) <i>Two Treatises</i>	Classical liberal rights/liberty lineage for the paper's conceptual framing of libertarianism. ²⁵
Rawls (1971) <i>A Theory of Justice</i>	Contrast class for modern liberal justice commitments (redistribution/positive liberty) that libertarians resist. ²⁵
Greene et al. (2001) fMRI moral dilemmas	Basis for the dilemma paradigm used to compare libertarians' "utilitarian" inclinations. ³³
Davis (IRI; cited in paper)	Measurement foundation for empathy distinctions; central to the "lower empathic concern" result and interpretation. ³⁴
Hong Reactance Scale / reactance theory	Measurement foundation for "psychological reactance," interpreted as tied to liberty concerns. ³⁵
Baron-Cohen empathizing/systemizing	Measurement foundation for the "systemizing > empathizing" pattern used to characterize libertarian cognitive style. ³⁶

Note on the full reference list

The paper's full bibliography is long (numbered at least through **88**). For verification, it is available on the journal page under "References." ³⁷

If you want, I can also reformat the entire bibliography into a standardized style (APA/Chicago) in a separate pass; the present report focuses on *central* references because the full list is extensive. ³⁸

Subsequent literature and intellectual influence

Citation profile and where it shows up

Google Scholar: The paper is widely cited; one accessible indicator is the listing on Ravi Iyer's Google Scholar profile showing **1,231 citations** for the 2012 PLOS ONE article. ⁵

PhilPapers: PhilPapers indexes the paper and shows a smaller, philosophy-filtered set of citations (the PhilPapers record displays "View all 56 citations," though the full list page was not accessible in this session). ³⁹

Where it's used: Many citing works are not about libertarianism per se; they use the paper as evidence about (a) ideology and moral foundations, (b) liberty as a moral domain, (c) empathy/analytic-thinking correlates of political orientation, and (d) measurement debates about MFT and the MFQ. ⁴⁰

Major follow-up lines: extensions, applications, and critiques

Extensions and consolidations within Moral Foundations Theory

A major consolidation text is the 2013 chapter "**Moral Foundations Theory: The Pragmatic Validity of Moral Pluralism**" (Graham, Haidt, Koleva, Motyl, Iyer, Wojcik, Ditto). It explicitly discusses the theory's assumptions and reviews empirical findings, including discussion of libertarians and related constructs (e.g., reactance) in the MFT framework. ⁴¹

This line of work tends to treat the 2012 libertarian paper as **supportive evidence** that MFT can illuminate real-world political moral differences and also as a reason to take **liberty** seriously as a moral concern that may not be captured by the original five-foundation measure set. ⁴²

Measurement and psychometrics critiques of the MFQ/MFT ecosystem

A substantial body of later work focuses not on libertarians specifically, but on whether the **Moral Foundations Questionnaire** measures what it claims, across populations and contexts.

- In 2021, **Zakharin & Bates** (PLOS ONE) argue that common five-factor MFQ models often fit poorly and propose a revised structural model (including additional structure beyond the original foundations). Importantly for this report, they explicitly cite Iyer et al. (2012) as the reference where liberty is identified as a possible moral foundation, noting that liberty is **often omitted** in questionnaire studies of MFT. ⁴³
- In 2024 (online) / 2025 (issue), **Blumenau & Lauderdale** (American Political Science Review) argue that prior MFT survey approaches likely **overstate** liberals-conservatives differences in "moral intuitions," and propose a paired-comparison design using many vignettes to more directly elicit intuitive judgments. Their paper is not about libertarians specifically, but it directly challenges a common interpretive move in the MFT literature—namely that MFQ self-reports straightforwardly reveal deep incompatibilities in moral intuition between ideological camps. ⁴⁴

These critiques matter for "Understanding Libertarian Morality" because that paper relies heavily on MFQ-style questionnaires and self-reports—even while acknowledging those limitations. ⁴⁵

Liberty foundation in later computational and applied work

As “liberty” becomes a recognized moral dimension in parts of the MFT ecosystem, it also becomes an object of lexicon-building and computational social science (e.g., attempts to detect liberty language in text). One example is recent work building lexical resources for the “liberty/oppression” foundation (presented as part of the MFT frame). ⁴⁶

While such work is often downstream and methodological, the 2012 libertarian paper remains part of the upstream rationale for why liberty deserves dedicated measurement. ⁴⁷

Connections to empathy and cognitive style debates

A continuing debate in political psychology concerns whether ideological differences in empathy and analytic thinking reflect deep dispositions, measurement artifacts, or context-sensitive motivations.

One later strand (illustrative example) explicitly cites Iyer et al. (2012) as part of the literature reporting political differences in empathy, then explores whether these differences are driven by motivational factors and target-group choices. ⁴⁸

Newer “bridge” results consistent with the paper’s libertarian/systemizing theme

A 2024 paper in **Molecular Autism** (Greenberg et al.) leverages Moral Foundations Theory and empathizing–systemizing theory. In its abstract, it reports that (in typical people) **systemizing is positively correlated with Liberty** (described as “hypervigilance against oppression”) and that **the percentage of libertarians is highest in systemizing cognitive types**—a pattern broadly consonant with the earlier libertarian paper’s “systemizing > empathizing” description. ⁴⁹

Map of intellectual influence

The table below summarizes *selected* influential or directly relevant citing works and how they use or relate to Iyer et al. (2012). “Stance” is coded as: **Pro/Extension** (builds on the paper or treats it as evidence), **Mixed/Methodological** (uses it but mainly for method debates), or **Critical** (argues that key measurement/interpretive moves in the broader literature are overstated). Citations are best-effort from accessible indicators in this run (not a comprehensive bibliometric audit). ⁵⁰

Citing work	Year	Main claim relevant to Iyer et al. (2012)	Stance	Citation indicator captured here
Graham et al., "Moral Foundations Theory: The Pragmatic Validity of Moral Pluralism" (Advances in Experimental Social Psychology chapter)	2013	Synthesizes MFT and reviews findings; discusses libertarian-related constructs (e.g., reactance) as part of MFT's empirical reach. ⁵¹	Pro/Extension	Google Scholar profile lists this chapter at ~3,920 citations (as displayed on Iyer's Scholar profile list). ⁵
Zakharin & Bates, "Remapping the foundations of morality ... MFQ" (PLOS ONE)	2021	Notes liberty as a proposed foundation but often omitted; explicitly cites Iyer et al. (2012) as the "libertarian morality" source for liberty's status and debates MFQ structure/fit. ⁵²	Mixed/ Methodological	Citation count not captured from a stable counter in this run (PLOS metrics are dynamic). ⁵³
Blumenau & Lauderdale, "Liberals and Conservatives Rely on Very Similar Sets ..." (APSR)	2024 (online) / 2025 (issue)	Argues MFT survey methods likely overstate left-right differences in intuitive moral judgments; cites Iyer et al. (2012) in the broader MFT measurement context. ⁵⁴	Critical (of common measurement inference)	Cambridge page shows "Cited by 5" (Crossref-based). ⁵⁵
Greenberg et al., "Moral foundations in autistic people and people with systemizing minds" (Molecular Autism)	2024	Reports systemizing correlates with Liberty and libertarian identification is most common among systemizing cognitive types (aligning with "systemizing" theme). ⁴⁹	Pro/Extension	Too recent; citation count not captured here. ⁵⁶

Timeline of major developments

timeline

title Understanding Libertarian Morality (Iyer et al. 2012) – influence and debates

2010 : Pre-publication discussion of an "Understanding Libertarian Morality" manuscript in popular press (under review)

2012-08-21 : Iyer, Koleva, Graham, Ditto & Haidt publish PLOS ONE article; libertarians high on liberty, low on other moral concerns; systemizing/reactance emphasized

2013 : Graham et al. publish major MFT synthesis chapter reviewing applications and debates

2021-10-22 : Zakharin & Bates (PLOS ONE) critique/reshape MFQ psychometrics; explicitly cite Iyer et al. as liberty-foundation source and note liberty often omitted

2024-07-31 : Blumenau & Lauderdale publish online APSR article arguing MFT survey methods overstate ideological differences in moral intuitions

2024 : Greenberg et al. (Molecular Autism) connect systemizing to liberty and libertarian identification patterns

2025-05 : APSR issue publication (Vol. 119, Issue 2) of Blumenau & Lauderdale; measurement debates continue

(Each timeline node corresponds to sources cited in this report.) ⁵⁷

Strengths, weaknesses, and further reading

Strengths of the paper

The paper's most defensible strengths (based on what it actually does and what it acknowledges) are:

Its **scale and convergence strategy**: many measures, often large Ns, with a consistent libertarian pattern across moral values, dispositions, and social measures—this is part of why it became influential. ⁵⁸

Its **conceptual bridge between political ideology and moral psychology**: it operationalizes libertarianism as a meaningful third cluster (not reducible to liberal-conservative) and uses that case to stress how dispositions, values, and narratives can align. ⁵⁹

Its **explicit self-critique**: the authors directly acknowledge nonrepresentativeness and self-report limitations rather than presenting the results as population-level facts. ¹³

Weaknesses and main points of vulnerability

The most important vulnerabilities are also explicitly flagged by the authors and emphasized in later critique literatures:

Sampling and generalizability: The volunteer internet sample skews (as described by the authors) and is not a probability sample; this complicates any attempt to generalize to “all libertarians” or to different national contexts. ¹³

Self-report and measurement validity: Even if consistent, self-reports can reflect identity narratives and post-hoc rationalizations. Later work across the MFT space argues that MFQ-style measurement may elicit reflective “System-2” judgments and identity signaling, potentially overstating differences in *intuitive* moral cognition. ⁶⁰

MFQ factor structure and the liberty foundation problem: Subsequent psychometric critiques argue MFQ factor structure and invariance are contested; adding liberty items does not automatically solve fit. Zakharin & Bates explicitly note that liberty is often omitted and that structural fit issues persist, even motivating redesigned models. ⁶¹

Causality: The evidence is largely correlational; the paper itself emphasizes it cannot establish causality even though it offers an explanatory narrative and mediation models. ⁶²

Accessible further reading for non-specialists

If your goal is to understand the paper without being a philosophy major, it helps to read one “big picture” moral psychology overview, one “political liberty” conceptual text, and one “measurement critique” paper.

Moral psychology background: - **Haidt (2012), *The Righteous Mind*** is directly referenced by the article and is written for a broad audience; it provides an accessible entry into the moral intuitionist framing used in the libertarian paper. ⁶³

- **Graham et al. (2013), “Moral Foundations Theory: The Pragmatic Validity of Moral Pluralism”** is a deeper but still readable synthesis of MFT’s assumptions and findings. ⁵¹

Political philosophy concepts used in the paper: - **Isaiah Berlin’s liberty distinction** (negative vs positive) is the key conceptual tool the paper uses to explain divergence between libertarian and modern liberal policy intuitions. ²⁵

- **Locke** is a canonical anchor for the historical “liberty” lineage referenced in the paper’s framing. ²⁵

Measurement and critique / “how robust is this literature?”: - **Zakharin & Bates (2021, PLOS ONE)** is an accessible open-access psychometric critique-and-rebuild of the MFQ, explicitly engaging the liberty-foundation issue and citing Iyer et al. (2012). ⁴³

- **Blumenau & Lauderdale (2024/2025, APSR)** is a high-level political science critique about how moral foundations differences should be measured if MFT is really about intuition. ⁶⁴
